

The Great Convergence

How FRAML, AI, Crypto and Quantum are
Redrawing the Financial Crime Battlefield

One transaction. Five disciplines. No single owner.

**Nobody owns the complete picture.
Criminals see one system. Institutions see separate disciplines.**

The battlefield has changed.

These are not parallel developments. They are converging into a new, singular operating environment.

Criminals have become adaptive.

Static Institutional Response

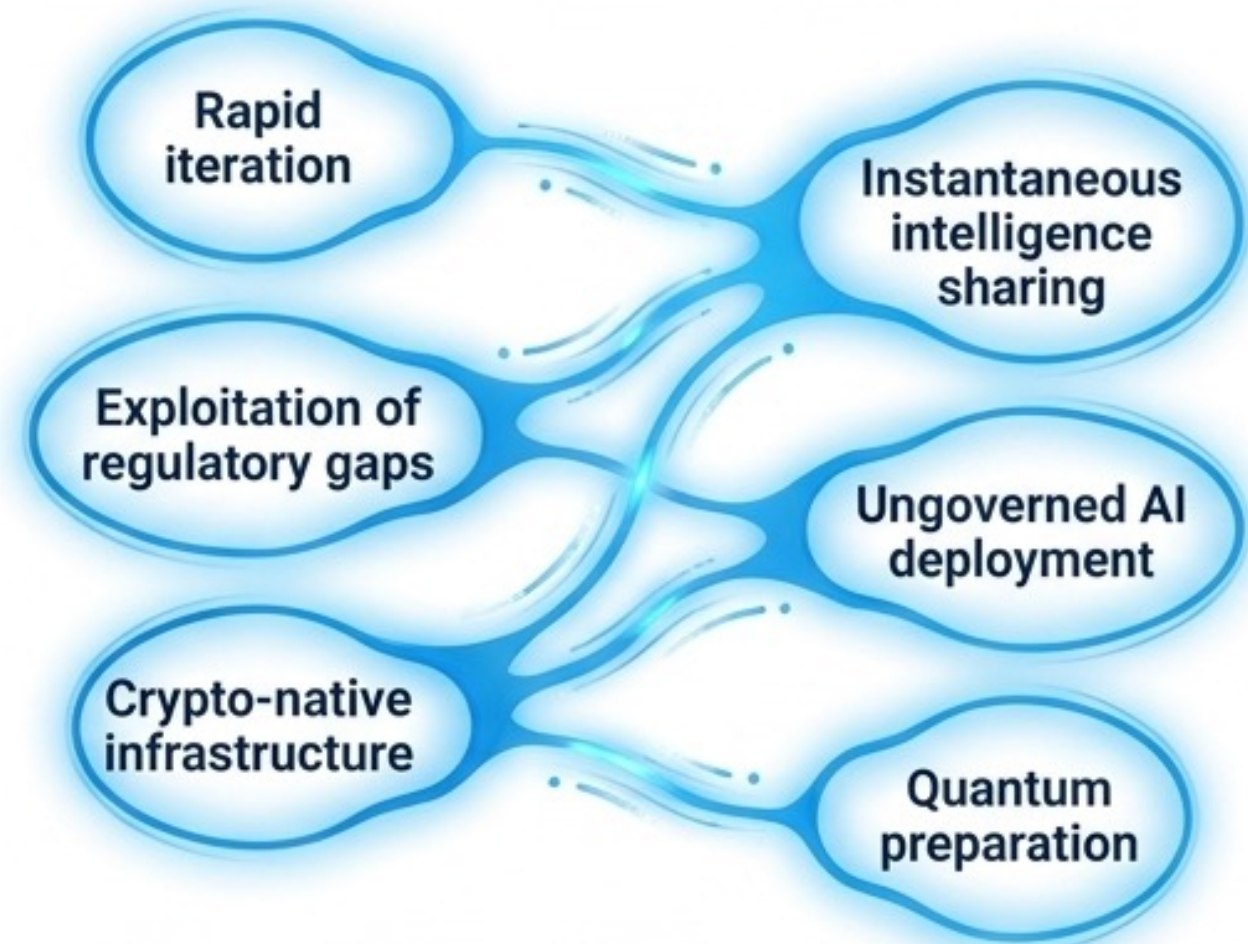

Static rules

Siloed intelligence

Deliberate regulatory pacing

Fragmented infrastructure

Learning Criminal Ecosystem

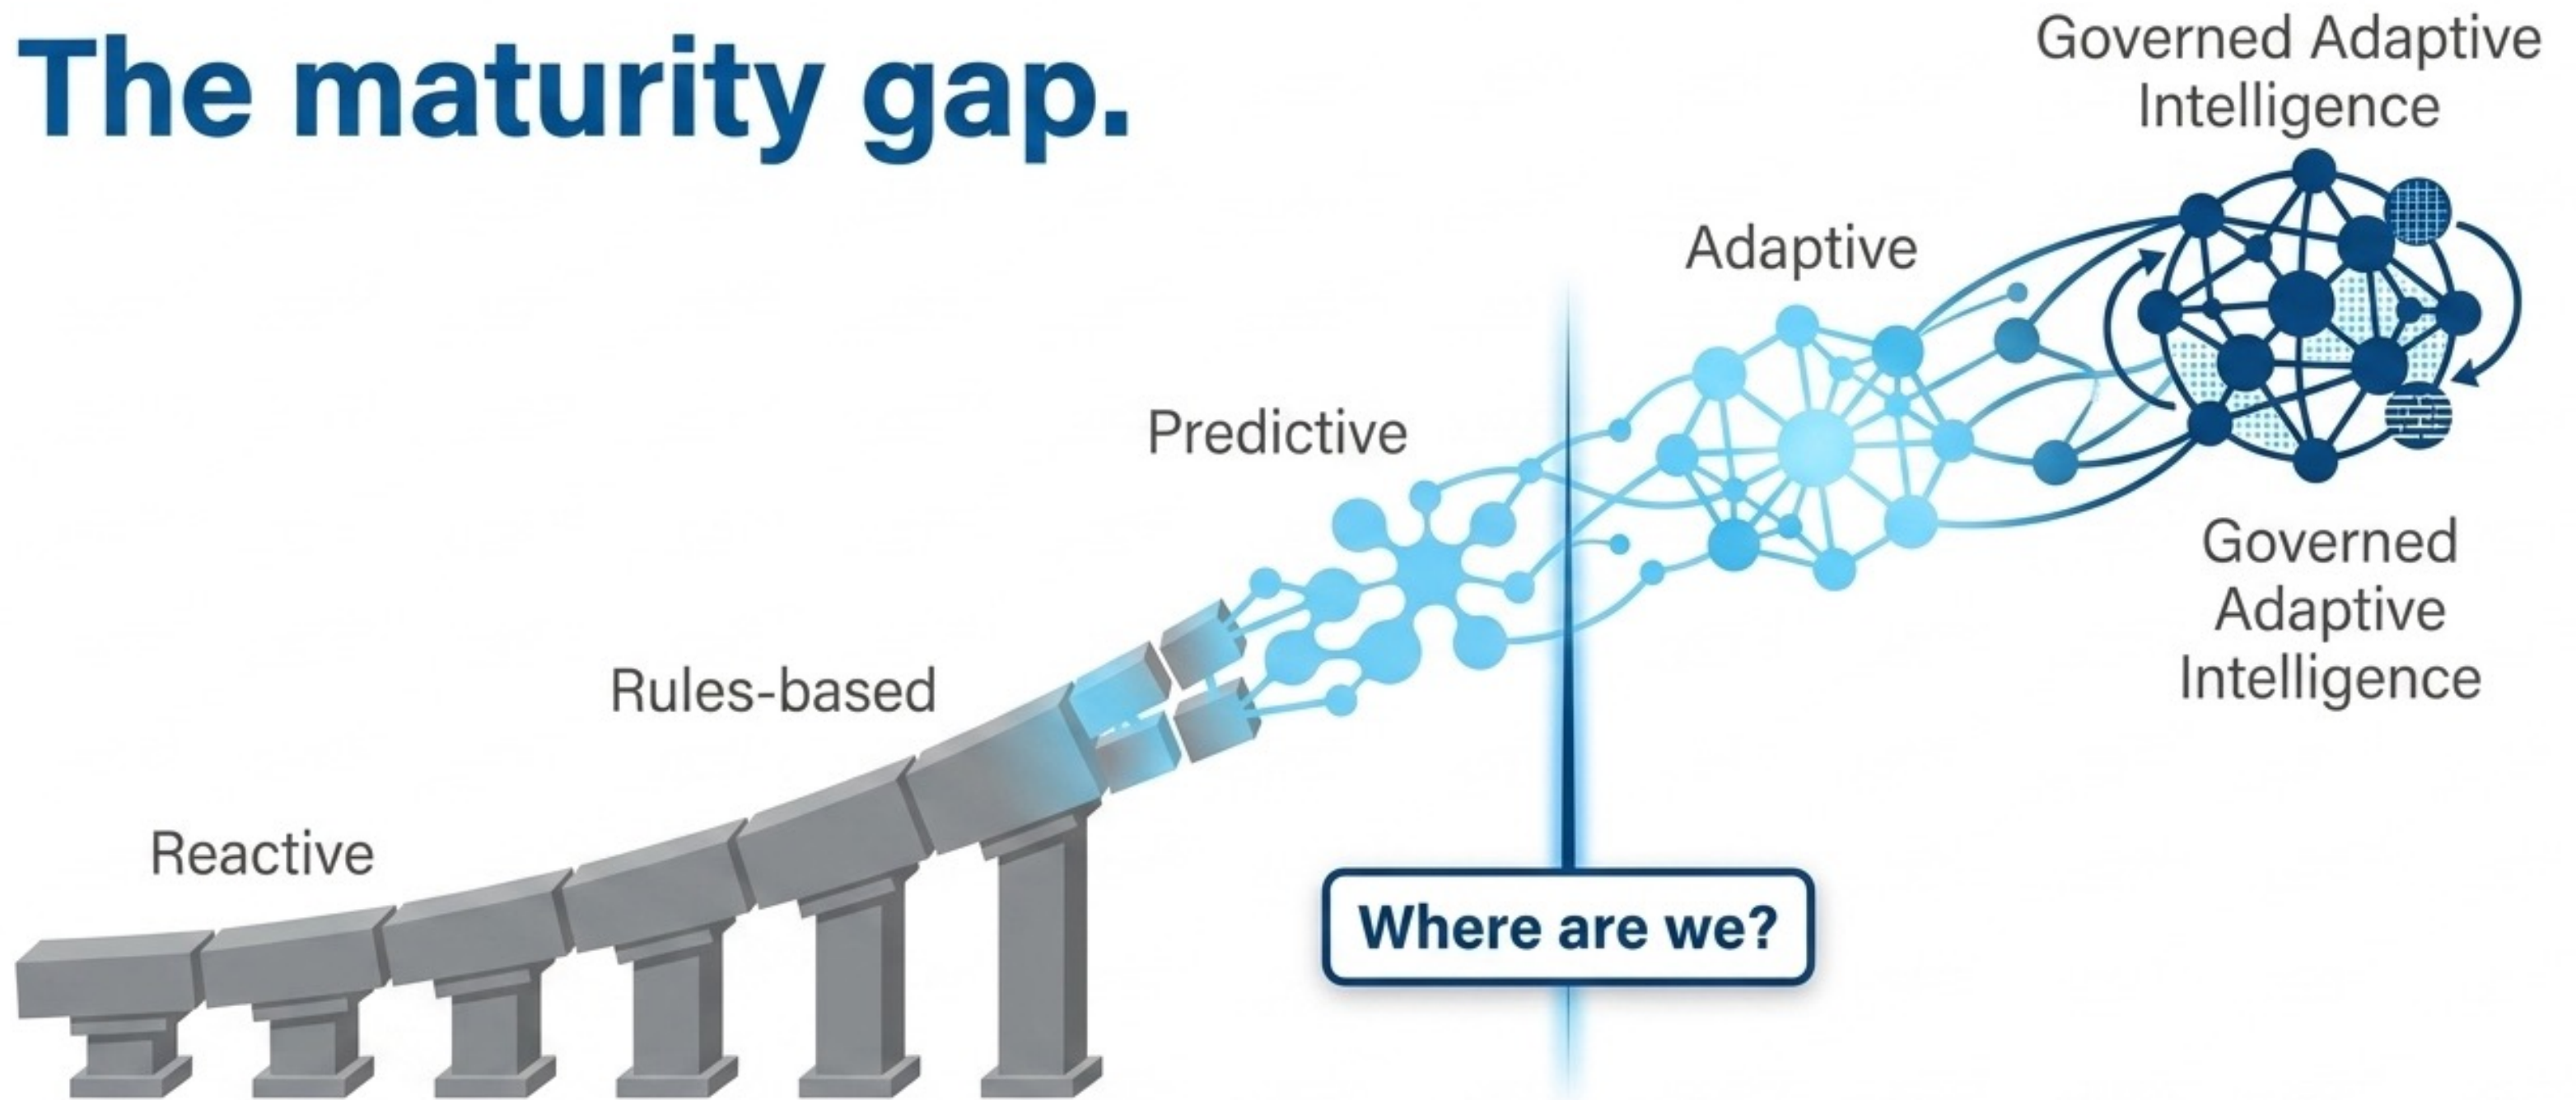

The challenge is no longer intelligence. It is adaptability.

Are our frameworks fit for purpose?

We are not asking whether these frameworks are good.

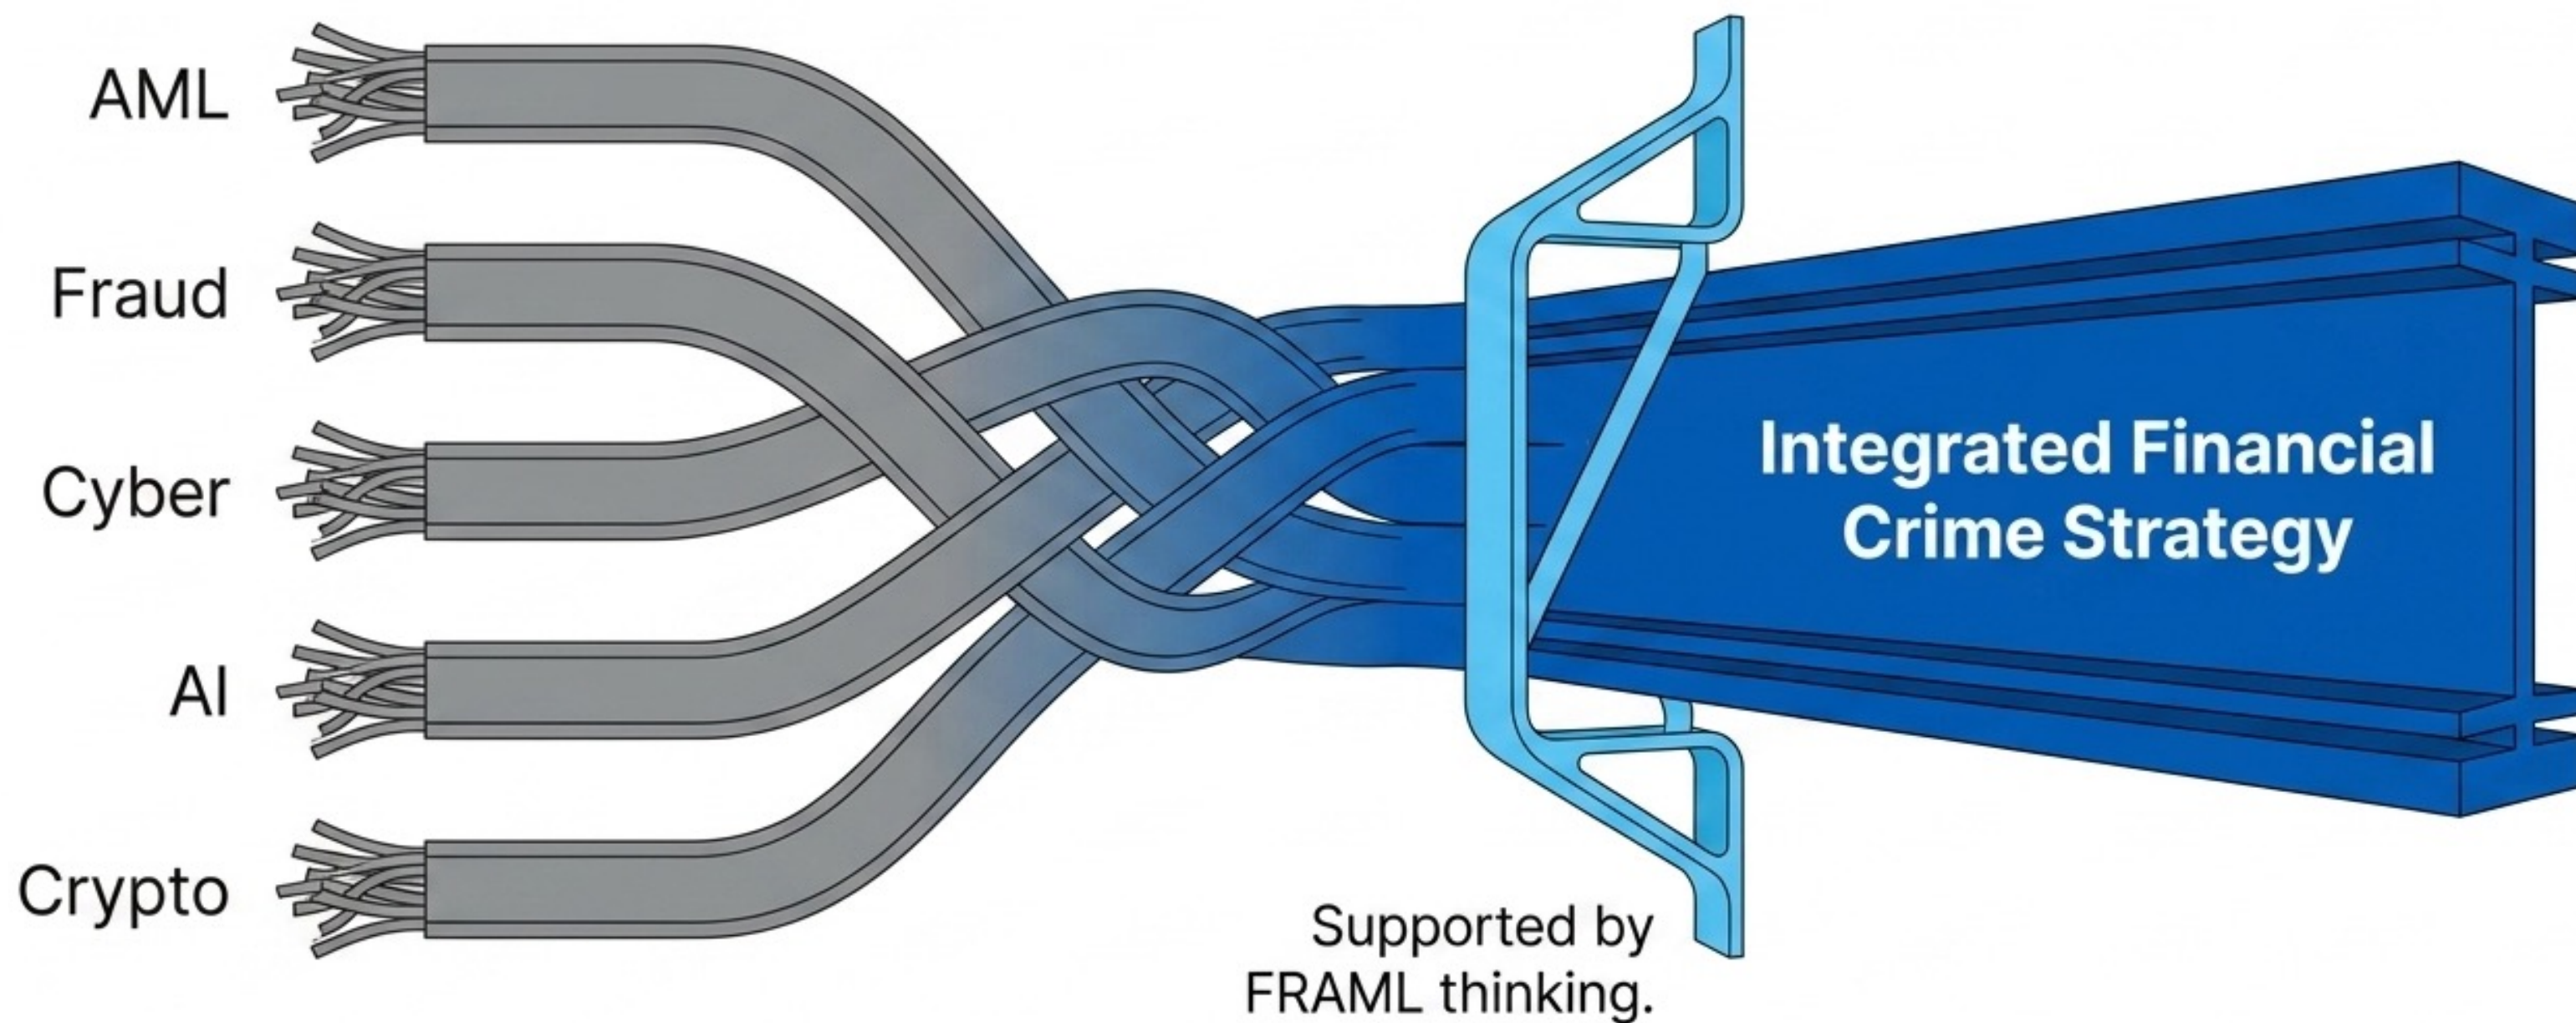

We are asking whether they were designed for today's environment.

The maturity gap.

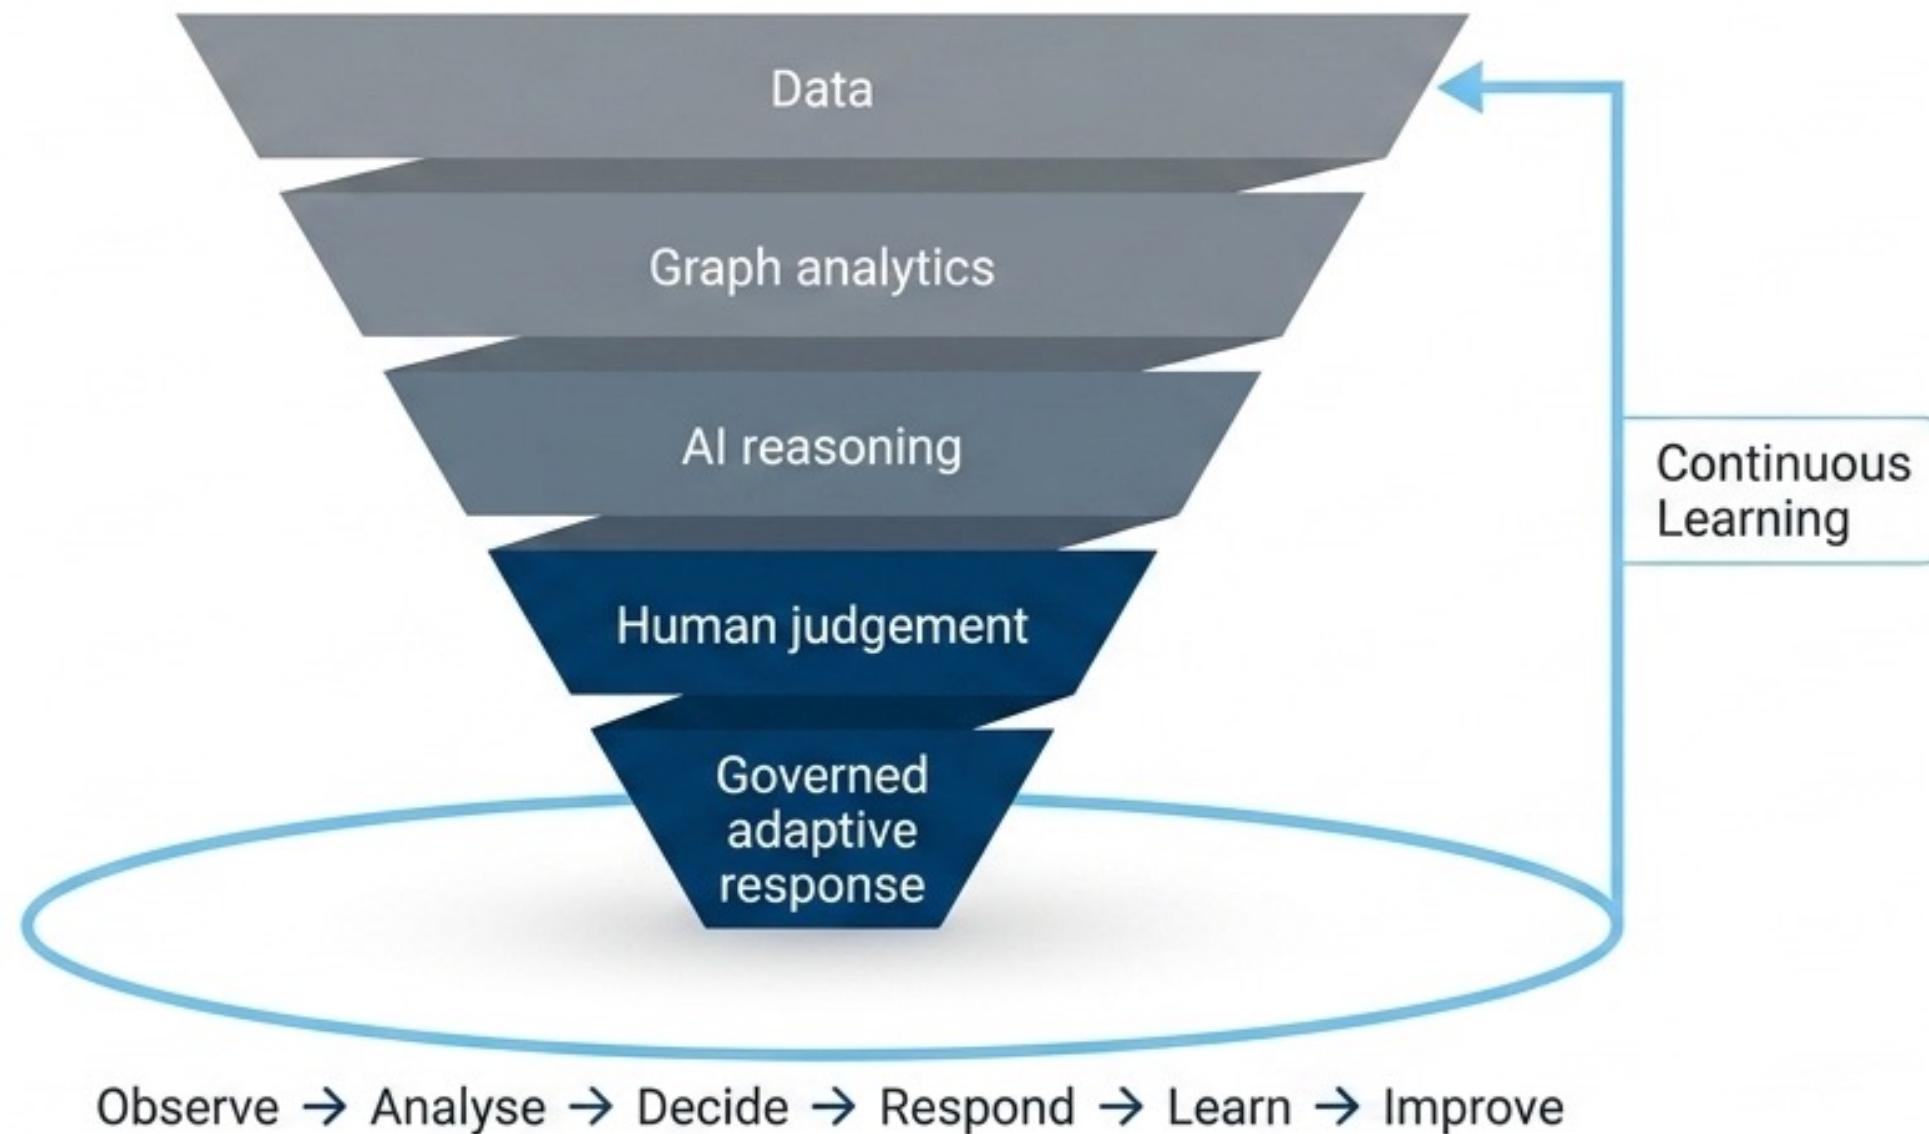

Digitisation $\neq$ Adaptability.
We must shift from deterministic systems to adaptive systems.

Strategy must converge.

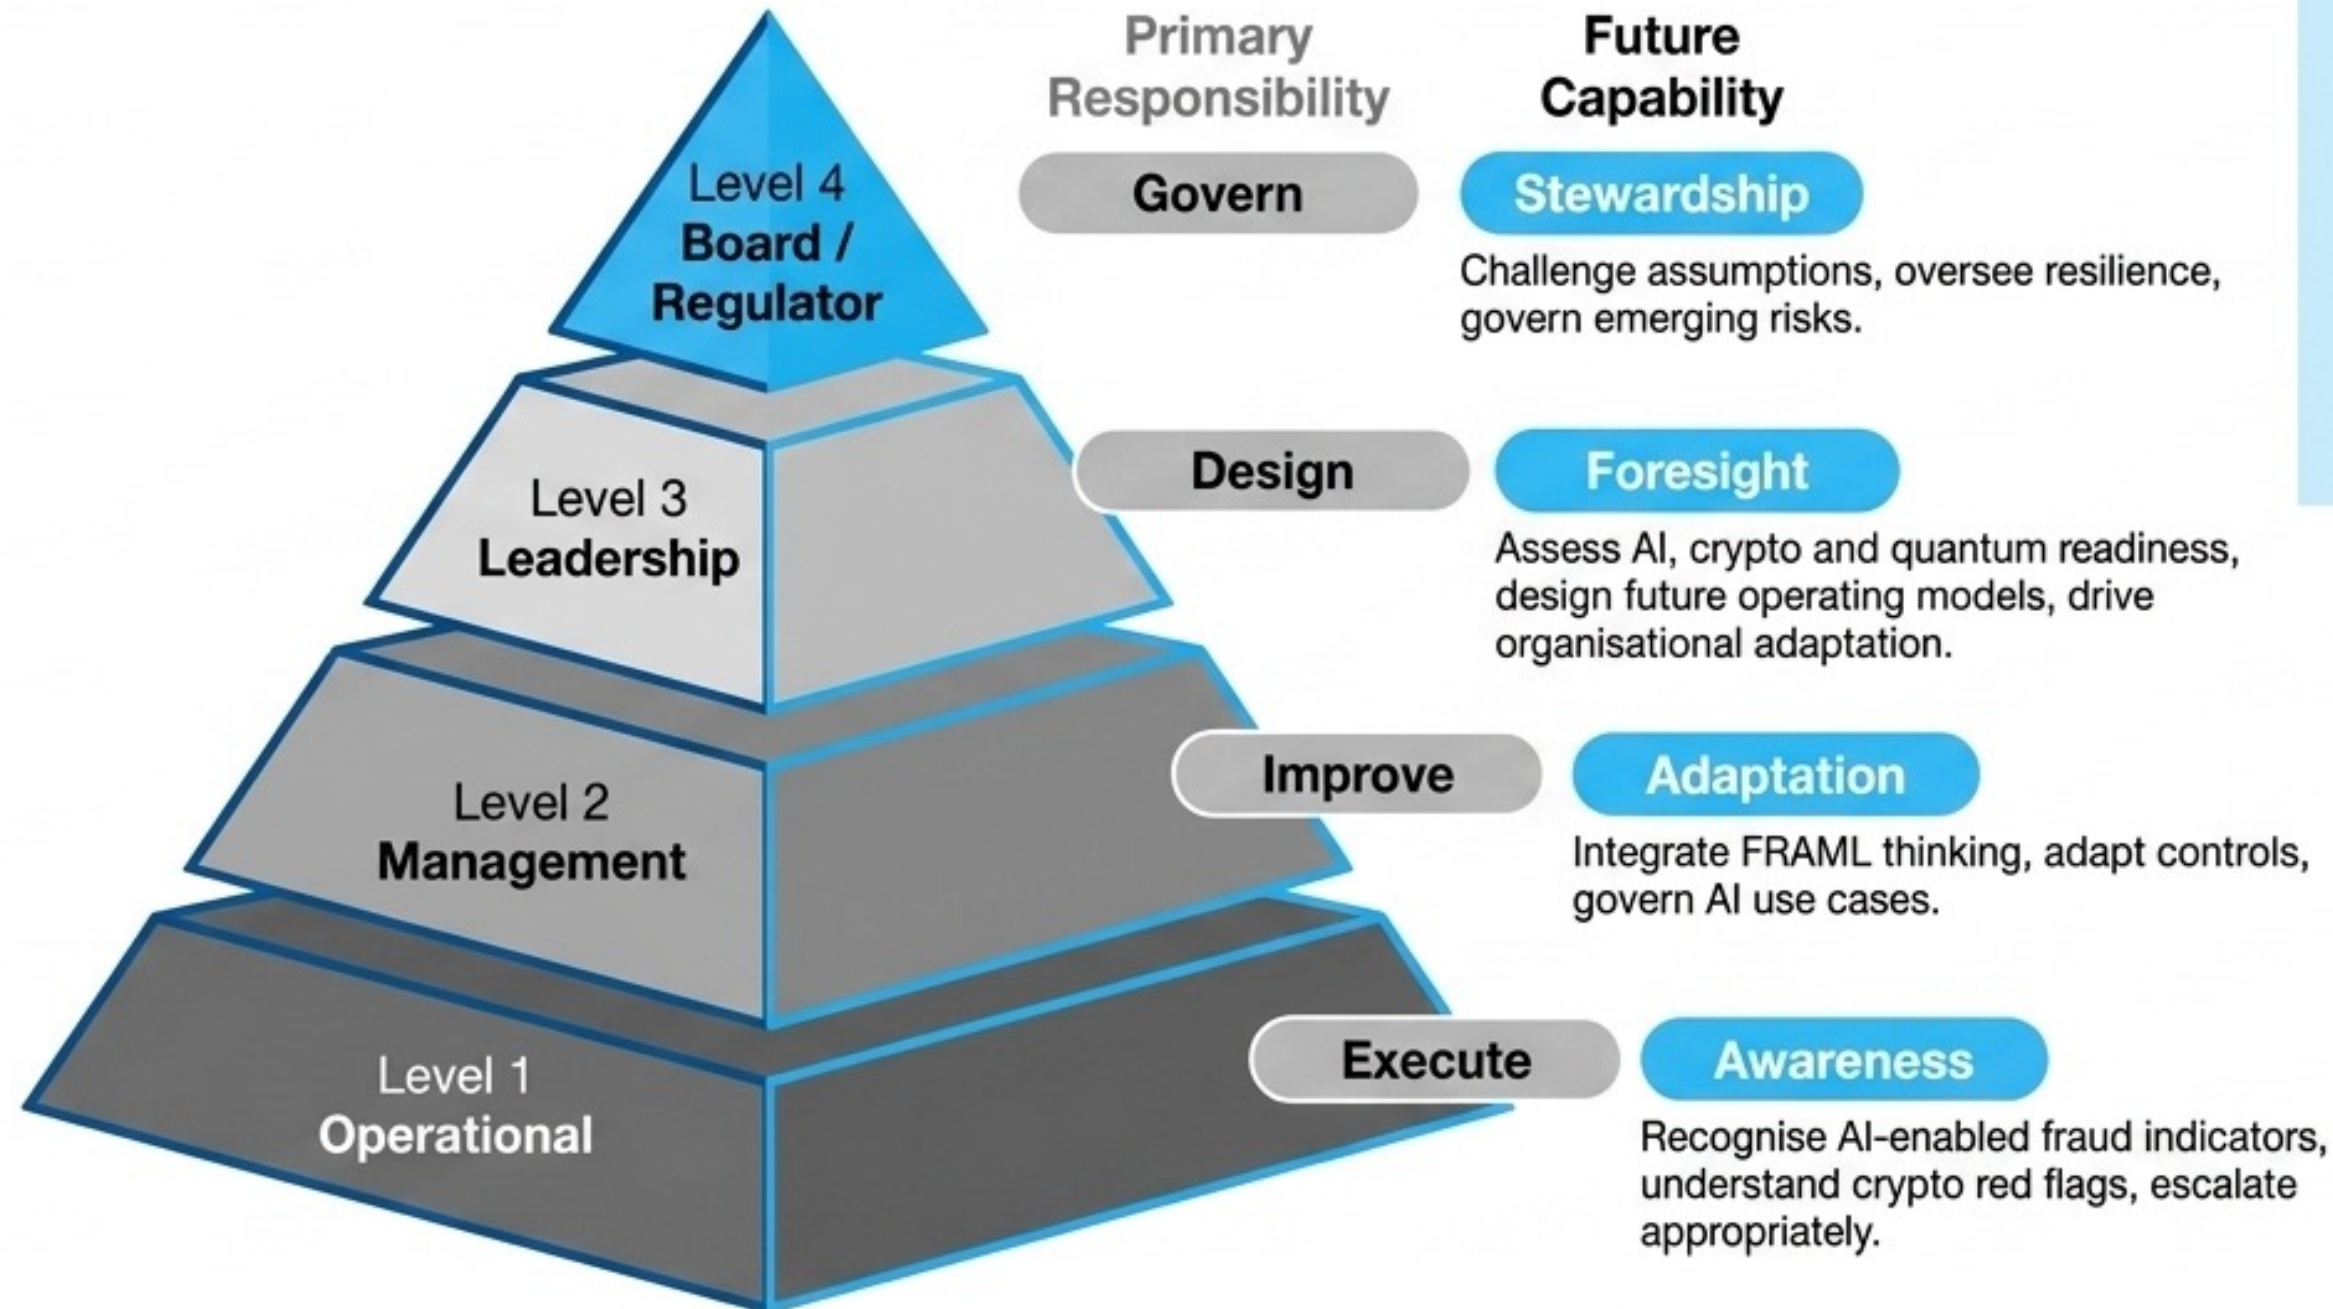

Technology must converge.

The future is not automation. The future is governed adaptation.

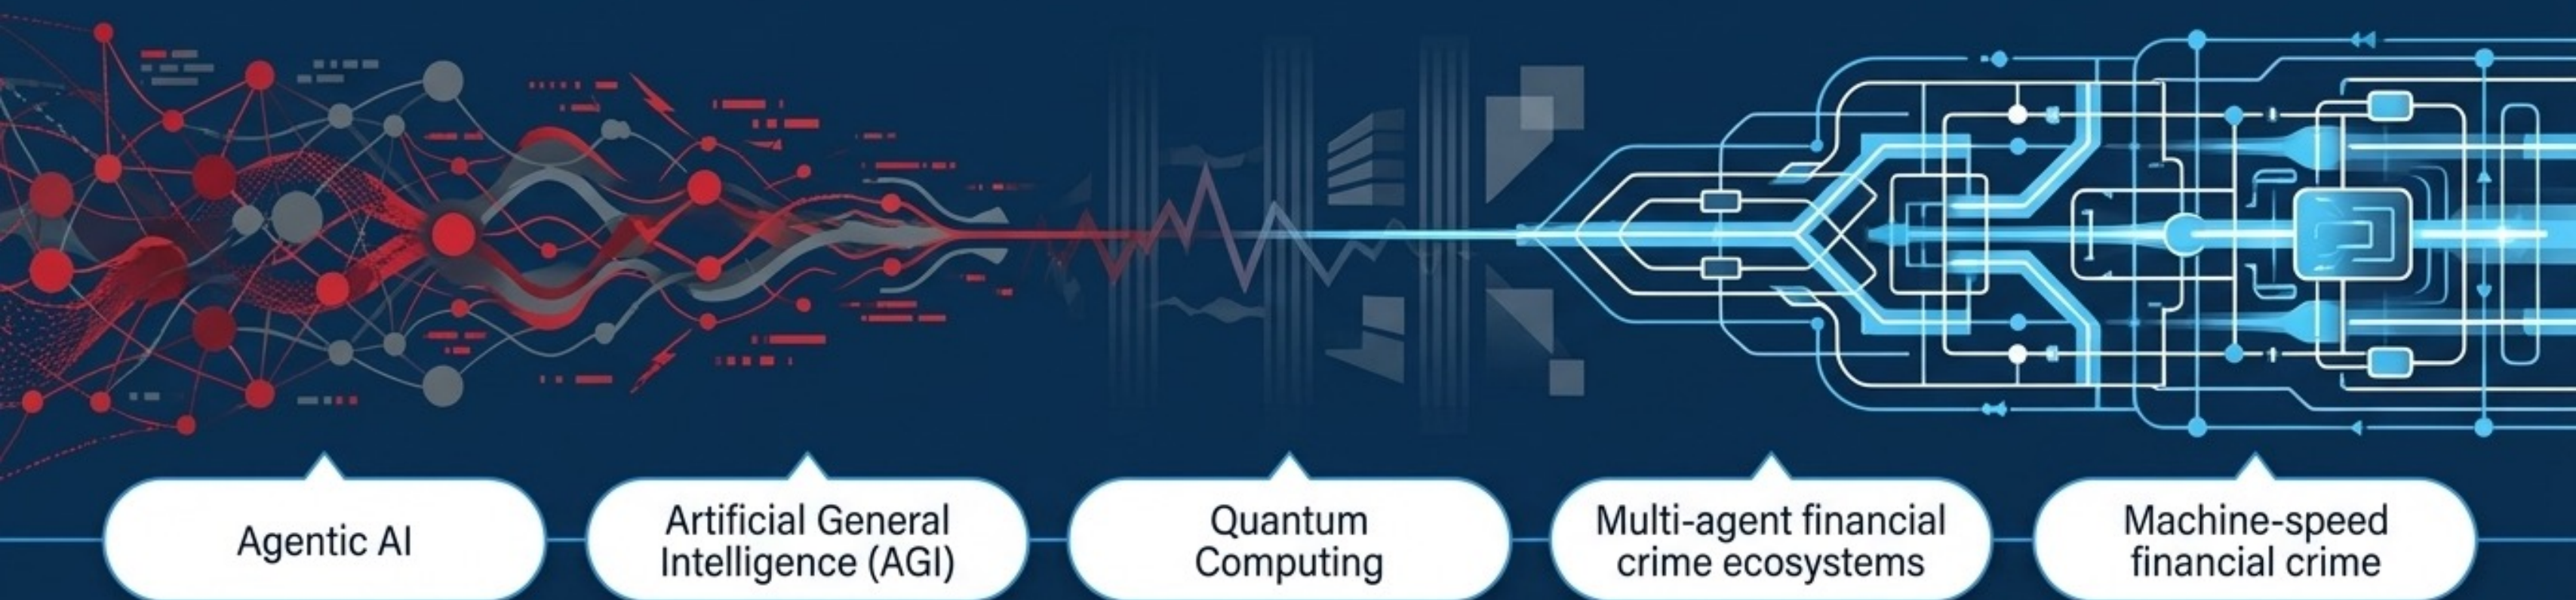

People Must Converge.

Capability Architecture

Not everyone must become strategic. But everyone must become more aware of the system in which they operate.

The next convergence: Autonomous Criminal Enterprises

The future competition will not be between human compliance officers and human criminals. It will be between adaptive AI-enabled criminal enterprises and adaptive, governed compliance ecosystems. The side that learns faster will have the advantage.

If criminals can learn faster than our controls can adapt, are we still managing financial crime—or merely documenting our failure to keep up?
